

The Role of Basic Life Support in the Modern Era

Raymond L. Fowler, MD, FACEP
Professor of Emergency Medicine, Surgery,
and Allied Health
The University of Texas Southwestern at Dallas

## www.rayfowler.com

### What do we do in EMS?

To provide care for all patients that is

- compassionate,
- competent,
- courteous,
- regardless of circumstances;
- to do no harm, and
- to treat others as we wish to be treated.

### When Considering Care...

What do we do CLINICALLY in the field that makes a difference in patient outcomes?

Isenberg 267

Jacobs LM 1984 Retrospective chart review ALS improves trauma scores and long-term survival in trauma patient Potter D 1988 Retrospective chart review ALS improves short tem, but not long-term survival in trauma patient Murphy IG 1993 Prospective chart review ALS confers better outcomes in victims of blunt trauma, but not penedating datuma. Table 1—Overview of articles and findings (ACLS = advanced cardiac life support; ALS = advanced life support; BLS = basic life support; CPR = cardiopulmonary resuscitation)

## Traumatic Emergencies

"Conclusions: The benefits of ALS care vary with the illness or injury being treated, as well as some other variables, such as transport time and the severity of the pathology."

In trauma patients, <u>no evidence</u> that ALS care improves survival in patients with short transport times to Level-I trauma centers as well as for patients with penetrating trauma.

<u>Does Advanced Life Support Provide Benefits to Patients</u>?: <u>A Literature Review</u>

D. Isenberg, R. Bissell. Prehospital and Disaster Medicine, July - August, 2005, pp. 265 - 270.

## Ontario Prehospital Advanced Life Support Trauma Study 2008

The OPALS Major Trauma Study showed that systemwide implementation of full advanced life support programs did not decrease mortality or morbidity for major trauma patients. "We also found that during the advanced life support phase, mortality was greater among patients with Glasgow Coma Scale scores less than 9".

"We believe that emergency medical services should carefully re-evaluate the indications for and application of prehospital advanced life-support measures for patients who have experienced major

trauma."

Journal of the Canadian Medical Association April 22, 2008, Pages 1141-1152

# Cardiac Emergencies What Works?

- -Timely defibrillation?
  - Definitely

- AdvancedCardiac LifeSupport?
  - Very little

## Ontario Prehospital Advanced Life Cardiac Arrest Study 2004

<u>Conclusions</u>: The addition of advanced life support interventions <u>did not improve the rate of survival</u> after out-of-hospital cardiac arrest in a previously optimized emergency medical services system of rapid defibrillation.

In order to save lives, health care planners should make cardiopulmonary resuscitation by citizens and rapiddefibrillation responses a priority for the resources of emergency medical services systems.

> New England Journal of Medicine August 12, 2004 Pages 647-656

## Respiratory Emergencies?

- Asthma/Allergic Reaction/Heart Failure?
  - Yes: Albuterol, Nitroglycerin, CPAP
  - EMT's can perform these treatments

# So in Respiratory Emergencies?

 Basic Airway management - assuring good oxygenation and ventilation?

- Yes! This is an EMT Skill

- Is CPAP an EMT Skill? Probably YES

## Ontario Prehospital Advanced Life Respiratory Study 2007

"Conclusion: The addition of a specific regimen of out-of-hospital advanced life support interventions to an existing EMS system that provides basic life support was associated with a decrease in the rate of death of 1.9 percentage points among patients with respiratory distress."

Study of 8138 patients in respiratory distress. Began with BLS only, and then they added drugs and endotracheal intubation. Very little difference found, and almost all ALS improvement was provided by the bronchodilator and nitroglycerin.

New England Journal of Medicine May 24, 2007 Pages 2156-2164

## Ontario Prehospital Advanced Life Respiratory Study 2007

"The most substantial change in therapeutic intervention was the marked increase in the use of medications for symptom relief; this intervention is not a component of advanced life support...

Thus, the benefit of the intervention in this trial may have been primarily due not to the availability of advanced-life-support techniques but to the use of nebulized salbutamol and sublingual nitroglycerin."

New England Journal of Medicine May 24, 2007 Pages 2156-2164

# Fowler's Law of Improved Work of Breathing

- A patient's work of breathing will appear to get better for one of two reasons:
- ► They're getting better
- **▶They're getting WORSE!!!**

## Prehospital Intubation?

-The Paramedic/ALS Skill?

Not so much

-Lets look at it...

#### Literature and Research...

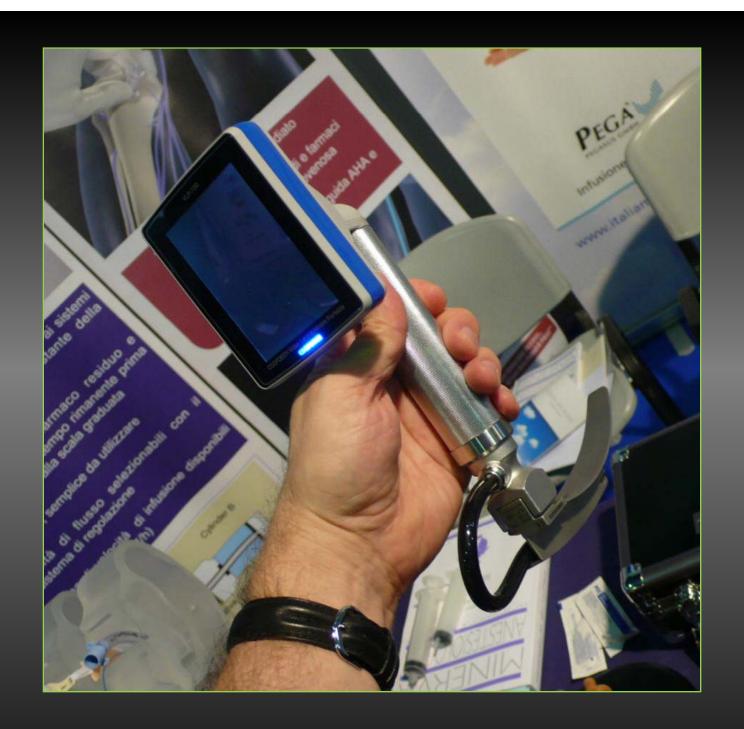

- "Prehospital intubation...has not been shown to improve outcomes and may cause significant harm in the hands of inexperienced operators."
- "Anything which delays transfer to definitive care in severe trauma is inappropriate."

Academic Emergency Medicine February 16, 2006

## EMS Literature and Research Concluding Thoughts

 "If at all possible, endotracheal intubation is a procedure to avoid. If BLS adjuncts can maintain an open airway, promote good oxyhemoglobin saturations and adequately protect the patient from aspiration, then they are clearly the preferred choice of care."

Howard Rodenberg, MD, MPH
Journal of Emergency Medical Services

#### Status of Current Protocols

- They are already designed for both BLS and ALS care
- EMT staffed
   Ambulances are
   already in policy
   because medical
   directors often have
   already approved
   their use

### Potential Ambulance Designs

-BLS

-ILS

-ALS

-MICU

E.P.A.B. Emergency Physicians Advisory Board	Page:	1-0
Medical Control for MedStar System	Effective Date:	January 1, 2008
	Replaces:	April 9, 2007

#### 1 EXPLANATION OF THE LEVELS OF CARE

#### **Basic Life Support**

- 1. Emergency Care Attendants
  - a. First Responder Agency ECA level employee

#### Intermediate

1. Emergency Medical Technician-Intermediate

#### **ALS First Responder**

1. Emergency Medical Technician-Paramedic

#### FRO Advanced / Lead Secondary Paramedic

Emanage Madical Taskaisian Danamadia

#### Conditional Primary Paramedic / Primary Paramedic

- Emergency Medical Technician-Paramedic
  - c. Conditional Paramedic: MedStar Lead Conditional Primary Paramedic level employee approved by EPAB and assigned to all level Priority calls. They may be on "restricted" status to perform a certain EPAB specialty skill. (i.e. Crash Airway)
  - d. Primary Paramedic: MedStar Lead Primary Paramedic level employee approved by EPAB and assigned to all level Priority calls without any restrictions.

#### BSP Orders

1. EPAB approved Base Station Physician.

#### EMT Ambulance

- A "Basic Life Support" Ambulance
  - Staffed with Emergency Medical Technicians (EMTs)
  - Perform According to National Clinical Standards of Care

# National Standard Treatments by EMT's

- Airway Adjuncts and Oxygen Delivery
- Bag-Valve-Mask
- CPAP
- Bleeding and Shock Management
- Cardiac Arrest
   Management/AED
- Bandaging/Splinting

- MedicationAdministration
  - Bronchodilators
  - Epinephrine SQ / IM
  - Nitroglycerin
  - Aspirin
  - Glucose
- Optional Airway:
  - Dual Lumen AirwayInsertion
  - Endotracheal Intubation??

# Suggested Policies Governing EMS Response / Levels

- We <u>CANNOT</u> be in a position of being unable to respond in a timely manner
- Basic EMT Trucks are a safe and timely answer
- We must stop responding to calls that we can prevent

## Critical Element

EMT Truck does NOT equal "old Basic Life Support"

From Dr. Ed Racht, 5/27/08
Chairman of the Texas
Governor's EMS and Trauma
Advisory Council

"We are stuck using antiquated nomenclature. 'BLS and ALS' no longer accurately fit EMS.

It is the clinical results that matter."

# Suggested Policies for Basic EMS Unit Implementation

- -We can produce EMT-staffed ambulances more quickly than paramedic ambulances
- -Trained by us, QA'd by us
- -Be on the street quickly
- -A "license to learn"

# Questions and Comments
